dplyr in R

Siyu Shen

2022-11-11

The **dplyr** package is mainly used for cleaning and sorting data. By using **dplyr** package, we can efficiently process the data, which is very important for people to do data analysis. In this note, I am going to introduce the most common used functions in **dplyr**.

```
#install 'dplyr' package
install.packages(dplyr)
#load 'dplyr' package
library(dplyr)
#load data 'mtcars' as example
data(mtcars)
#show the structure of the data 'mtcars'
str(mtcars)
## 'data.frame':
                     32 obs. of 11 variables:
   $ mpg : num 21 21 22.8 21.4 18.7 18.1 14.3 24.4 22.8 19.2 ...
   $ cyl : num 6646868446 ...
   $ disp: num 160 160 108 258 360 ...
    $ hp : num 110 110 93 110 175 105 245 62 95 123 ...
    $ drat: num 3.9 3.9 3.85 3.08 3.15 2.76 3.21 3.69 3.92 3.92 ...
    $ wt : num 2.62 2.88 2.32 3.21 3.44 ...
##
    $ qsec: num 16.5 17 18.6 19.4 17 ...
    $ vs : num 0 0 1 1 0 1 0 1 1 1 ...
##
    $ am : num 1 1 1 0 0 0 0 0 0 0 ...
    $ gear: num 4 4 4 3 3 3 3 4 4 4 ...
    $ carb: num 4 4 1 1 2 1 4 2 2 4 ...
There are 32 observations on 11 variables. The meanings of each variables are:
mpg: Miles/(US) gallon,
cyl: Number of cylinders,
disp: Displacement (cu.in.),
hp: Gross horsepower,
drat: Rear axle ratio,
wt: Weight (1000 lbs),
qsec: 1/4 mile time,
vs: Engine (0 = V-\text{shaped}, 1 = \text{straight}),
am: Transmission (0 = \text{automatic}, 1 = \text{manual}),
gear: Number of forward gears,
carb: Number of carburetors.
```

1. Pipe operator '%>%'

It is important to know the pipe %>% operator before we start to learn the functions in **dplyr** package. With the use of %>%, multiple functions can be wrapper together. And it can be used with any function.

```
# usage in filter() function
filter(data_frame, variable == value)
data_frame %>% filter(variable == value)

# usage in mutate() function
mutate(data_frame, expression(s))
data_frame %>% mutate(expression(s))
```

2. Filter by row: filter() function

You can use **filter()** function to filter the subsets by the given logic, which is similar to the **subset()** function, for example:

```
#filter when mpg is greater than or equal to 22
filter(mtcars, mpg >= 22)
##
                  mpg cyl disp hp drat
                                            wt qsec vs am gear carb
## Datsun 710
                 22.8
                        4 108.0 93 3.85 2.320 18.61
                                                     1
                                                        1
                                                                  2
## Merc 240D
                 24.4
                        4 146.7 62 3.69 3.190 20.00
                                                     1
## Merc 230
                 22.8
                        4 140.8 95 3.92 3.150 22.90
## Fiat 128
                 32.4
                        4 78.7 66 4.08 2.200 19.47
                                                                  1
## Honda Civic
                 30.4
                       4 75.7 52 4.93 1.615 18.52 1 1
                                                             4
## Toyota Corolla 33.9
                       4 71.1 65 4.22 1.835 19.90
                                                                  1
## Fiat X1-9
                 27.3
                        4 79.0 66 4.08 1.935 18.90 1 1
                                                                  1
                                                                  2
## Porsche 914-2
                 26.0
                        4 120.3 91 4.43 2.140 16.70 0 1
## Lotus Europa
                 30.4
                        4 95.1 113 3.77 1.513 16.90 1 1
#filter when cyl=4 or gear=3
filter(mtcars, cyl == 4 | gear == 3)
#filter when cyl=4 and gear=3
filter(mtcars, cyl == 4 & gear == 3)
```

3. Filter by column: select() function

#note: when using AND operation, avoid using '&&' instead of '&'

select() function selects subdatasets with column names as arguments. The **dplyr** package provides some special functions to be used in conjunction with the **select()** function to filter variables, including starts_with, ends_with, contains, matches, one_of, num_range, and everything.

```
#choose data 'iris' as example
data(iris)
iris = tbl_df(iris)
```

```
## # A tibble: 6 x 5

              1.5
                          0.2
## 9
              1.4
                           0.2
## 10
              1.5
                           0.1
## # ... with 140 more rows
#select the columns that not start with 'Petal'
select(iris, -starts_with("Petal"))
select(iris, !starts_with("Petal"))
#select the columns that end with 'Petal'
select(iris, ends_with("Width"))
#select the columns that contain with 'etal'
select(iris, contains("etal"))
#select the columns that the variables name is with 't'
select(iris, matches(".t."))
#select the columns you want directly
select(iris, Petal.Length, Petal.Width)
#select multi-columns by using colon
select(iris, Sepal.Length:Petal.Width)
```

#show the 'iris' data

head(iris)

```
#when we cannot use the character vector filter, we need to use 'one_of()' function
vars <- c("Petal.Length", "Petal.Width")
select(iris, one_of(vars))

#return all columns, generally used when adjusting the order of variables in a dataset
select(iris, everything())

#return all columns, but reorder the columns and put 'Species' column in the front
select(iris, Species, everything())</pre>
```

4. mutate() and transmute()

mutate() adds new variables and preserves existing ones; transmute() adds new variables and drops existing ones.

4.1. mutate()

4.1.1. New columns

```
#create two more columns named 'cyl2' and 'cyl4'
head(mtcars %>% mutate(cyl2 = cyl * 2, cyl4 = cyl2 * 2))
## mpg cyl disp hp drat wt qsec vs am gear carb cyl2 cyl4
```

```

5. Ranking function

row_number: the results of the parallel rankings are in different order, and the elements appearing first are ranked first.

min_rank: the results of the tie ranks are the same, and the next rank will be occupied.

dense_rank: tied ranking does not occupy the ranking, for example: no matter how many tied for the second place, the subsequent ranking should still be the third place

percent_rank: rank by percentage

cume_dist: rank of cumulative distribution interval

ntile: roughly ranks vectors by dividing into n buckets. Larger buckets have lower rank.

```
x = c(5, 1, 3, 2, 2, NA)
row_number(x)
## [1] 5 1 4 2 3 NA
```

```
min_rank(x)
```

```
## [1] 5 1 4 2 2 NA
```

```
dense_rank(x)
```

```
percent_rank(x)
```

```
cume_dist(x)
```

```
Cume_dist(x)
```

```
ntile(x, 2)
```

```
## [1] 2 1 2 1 1 NA
```

[1] 4 1 3 2 2 NA

[1] 1.00 0.00 0.75 0.25 0.25

[1] 1.0 0.2 0.8 0.6 0.6 NA

head(mtcars%>%mutate(dense_rank=cume_dist(cyl)))

```
